PrimeRT Second Strand cDNA Synthesis Kit is a reagent designed to remove the RNA chain from the RNA-DNA hybrid chain synthesized in the first-strand cDNA synthesis and to synthesize the second strand of cDNA, ultimately forming double-stranded cDNA. This kit contains various reagents necessary for the synthesis of the second strand of cDNA. The kit utilizes RNase H to introduce cleavage sites in the RNA-DNA hybrid chain, allowing DNA Polymerase I to catalyze the formation of the second strand of cDNA through a nick translation reaction. Double-stranded cDNA synthesized using this kit can be directly used for subsequent conventional PCR, real-time PCR, cDNA library construction, and other applications.

### Kelengkapan dan Keterangan Lainnya:

Blunt/TA Ligase Master Mix is a ready-to-use solution of T4 DNA Ligase, proprietary ligation enhancer, and optimized reaction buffer. This master mix is specifically formulated to improve ligation and transformation of both blunt-end and single-base overhang substrates. The master mix format simplifies reaction set-up, ensures an optimized ratio of enzyme and buffer components, and yields robust, rapid ligation of all types of DNA ends using a short incubation time at room temperature. No thawing is necessary as it remains liquid during storage at -20°C.\* Ligations for subcloning can be carried out in small volumes with low DNA concentrations, allowing users to conserve precious DNA samples and directly transform many strains of chemically competent E. coli without dilution.
